Connect the cable to the SWR analyzer and terminate the other end with a 50 ohms load Measure the SWR If you get 1:1, then the cable impedance is 50 ohms If the SWR is above 1:1, change the frequency to maximize the SWR reading Calculate Zcable at the frequency where the SWR is maximum, or use the graph below:

resistive SWR bridge final copy - GQRP Club

higher SWR to the antenna socket, but the rig will always see one that is lower and therefore provide some protection to your PA transistor Because the design relies on using a resistive bridge, the transmitter output should be limited by how much power the resistors can safely dissipate
