where τ is the delay time in seconds Thus, it's easy to derive transfer functions for systems containing delays For example, a system with a cascade controller and unity feedback, but using an output sensor that is τ seconds late in reporting the output (a sensor delay) would have a transfer function calculated from a diagram like this:

Recitation 11: Time delays

where $\phi_{m,T}$ and $\phi_{m,0}$ are the phase margins with and without the time delay, respectively, and ω_c is the crossover frequency (which does not depend on the time delay) The above equation summarizes the main effect of a time delay, that is a reduction of the phase margin Moreover, the phase margin reduction increases as the crossover frequency increases
